PA10G Printer Applicator

The Wood Industry's Fastest Printer Applicator

The PA10G Printer Applicator is the culmination over 20 years' experience in the home building products industry. Listening to feedback from our customers, the PA10G is designed from the ground up for the rugged requirements of the modern mill environment. Implementation of a PA10G provides accurate and robust labeling solutions at the speeds of next generation handling lines in an adaptable package configurable to operate through PC, PLC, or Manual Control. Enclosed in an industrial grade heavy duty steel case, the PA10G's internalized components and limited moving parts means less wear on components, longer periods between tune-ups and better return over the lifetime of its purchase. Contact us to find out how our printer applicators save you money and improve mill efficiency.

Designed to Label

- Lumber •Panels •Boards

99.83%+
UP TIME IN
REAL
WORLD
TESTS

- Prints and applies over 300 pieces per minute
- Large capacity label supply
- Ribbon matching ensures reduced label & ribbon change time
- Can print "Next Label Up" for mills making random length
- Rugged simplicity – has few moving parts and is straightforward in its operation and maintenance
- Industrial grade heavy duty steel enclosure needs less than 30" of line space
- Adaptable to top, side, or bottom apply on any lumber, panel or board
- Designed for low power consumption
- Encoder based automatic speed compensation
- Powerful real-time controller board for fast and accurate system control with minimal latency
- Power-down setting memory requires no re-programming
- Remote monitoring & machine diagnostics included
- Able to integrate with PC's, HMI's, and Mill PLC's
- On-Site Support, Remote Tech Support, Staff Training, and Maintenance Agreements available

PA10G Printer Applicator

Why Do You Need an Oversize Label Capacity with Matching Ribbon?
“More Up Time and Fewer Label Roll Changeover”

Case Study: A North American based mill made lumber at 200LPM with 20% of the pieces being bar coded. By switching to IBC's PA10G, they reduced their roll change time by having to change rolls 222 times per year compared to 675 times per year with a competitor's system. That means saving 35 hours of labor per year and approximately \$45,000 extra per year in productivity uptime
